

1-1 OVERVIEW OF THE INTERNET

We start our journey by first defining a network. We then show how we can connect networks to create small internetworks. Finally, we show the structure of the Internet and open the gate to study the Internet in the next ten chapters.

1.1.1 Networks

A network is the interconnection of a set of devices capable of communication. In this definition, a device can be a host such as a large computer, desktop, laptop, workstation, cellular phone, or security system. A device in this definition can also be a connecting device such as a router a switch, a modem that changes the form of data, and so on.

1.1.1 Networks (Continued)

□ *Local Area Networks*

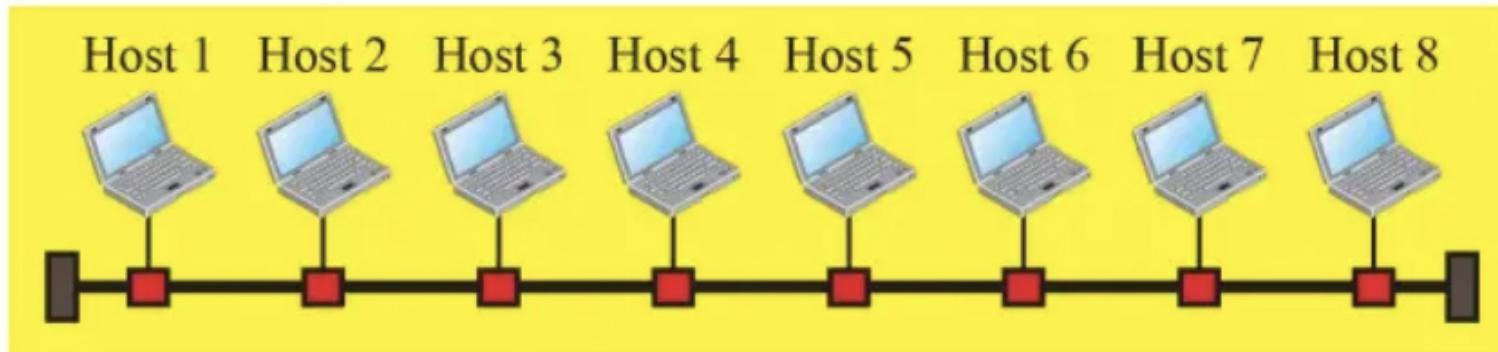

□ *Wide Area Networks*

❖ *Point-to-Point WANs*

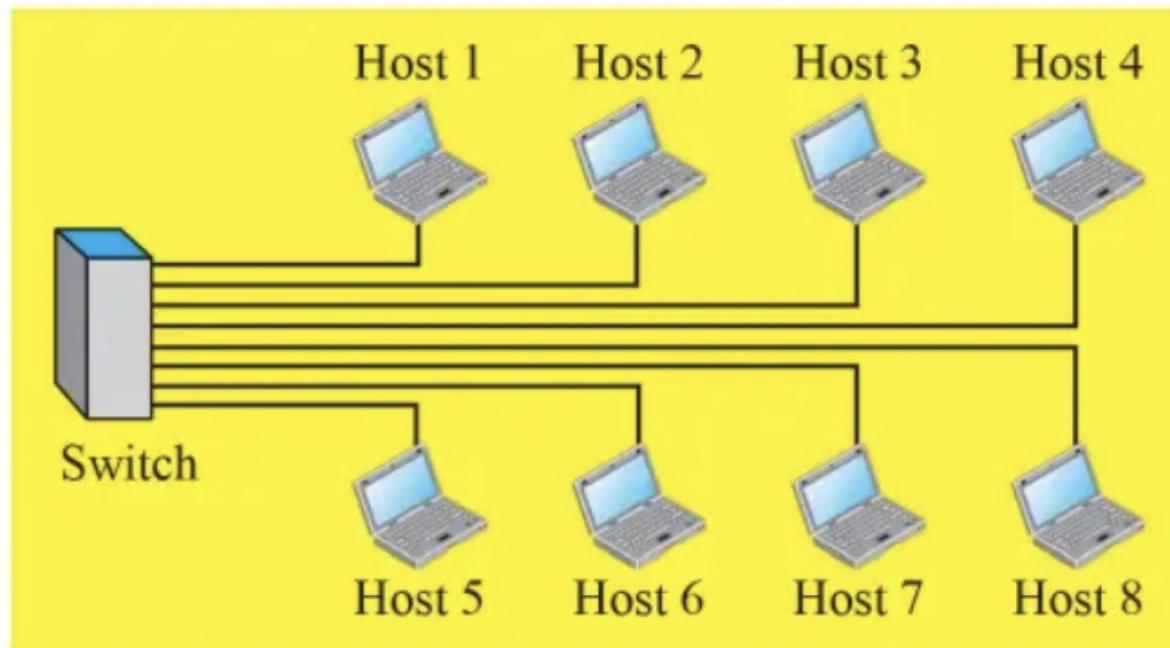

❖ *Switched WANs*

□ *Internetwork*

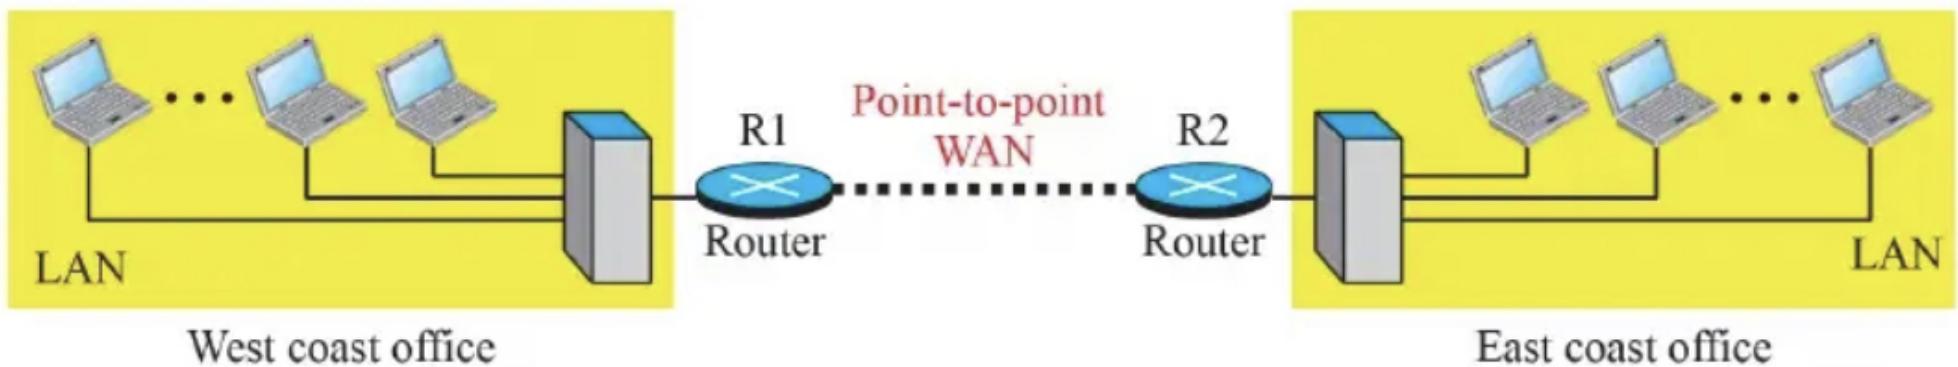

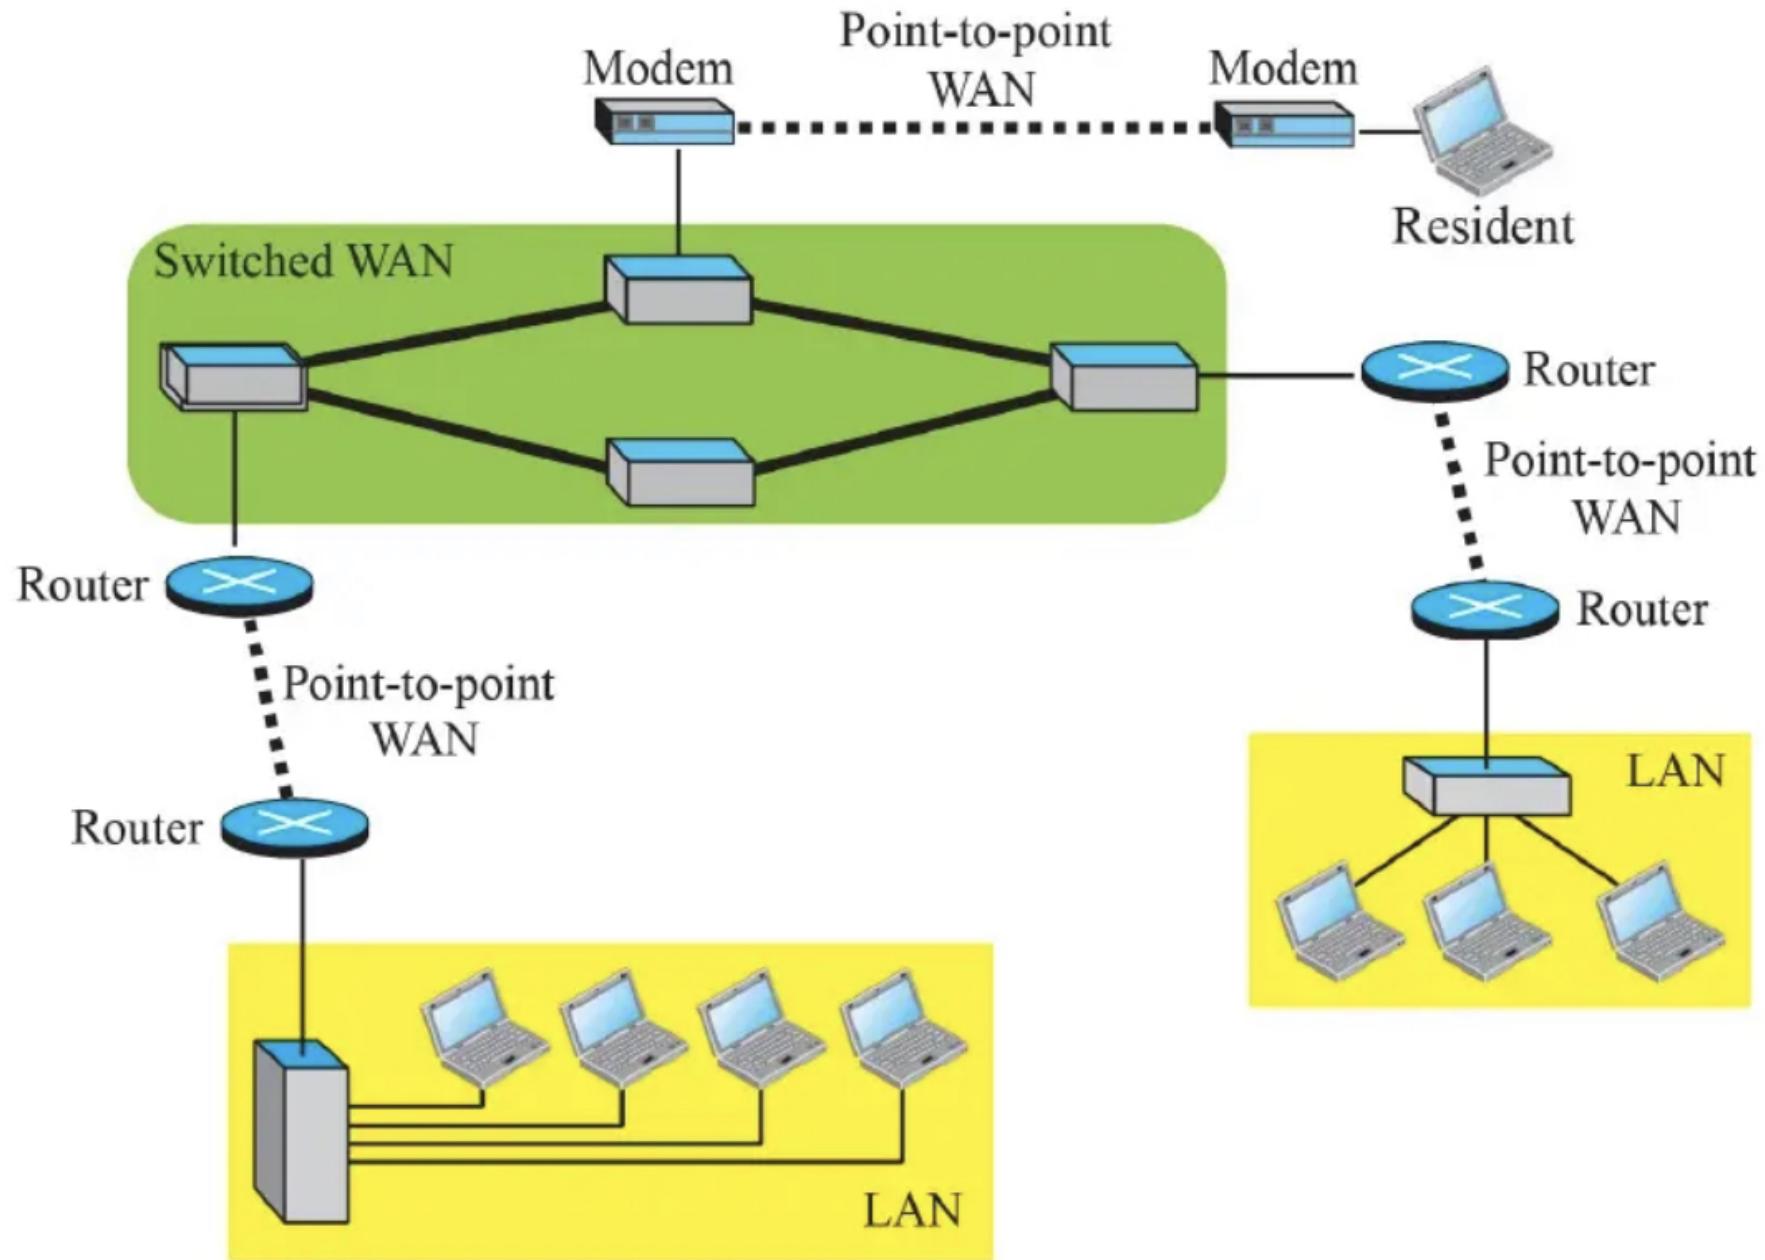

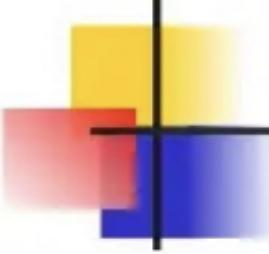

Figure 1.5: A heterogeneous network made of WANs and LANs

1.1.2 Switching

An internet is a switched network in which a switch connects at least two links together. A switch needs to forward data from a link to another link when required.

- ***Circuit-Switched Network***

- ***Packet-Switched Network***

1.1.3 The Internet

The most notable internet is called the Internet and is composed of thousands of inter-connected networks. Figure 1.8 shows a conceptual (not geographical) view of the Internet.

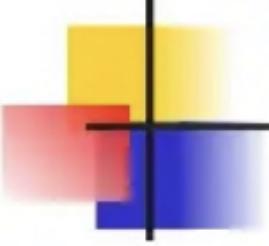

Figure 1.8: The Internet today

1.1.4 Accessing the Internet

The Internet today is an internetwork that allows any user to become part of it. The user, however, needs to be physically connected to an ISP. The physical connection is normally done through a point-to-point WAN. In this section, we briefly describe how this can happen, but we postpone the technical details of the connection until Chapters 6 and 7.

Using Wireless Networks

Direct Connection

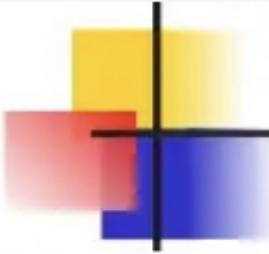

1.1.5 Hardware and Software

We have given the overview of the Internet structure. For communication to happen, we need both hardware and software. This is similar to a complex computation in which we need both a computer and a program. In the next section, we show how these combinations of hardware and software are coordinated with each other using protocol layering.

1-2 PROTOCOL LAYERING

A word we hear all the time when we talk about the Internet is protocol. A protocol defines the rules that both the sender and receiver and all intermediate devices need to follow to be able to communicate effectively. When communication is simple, we may need only one simple protocol; when the communication is complex, we need a protocol at each layer, or protocol layering.

1.2.1 Scenarios

Let us develop two simple scenarios to better understand the need for protocol layering.

- First Scenario (Figure 1.9)***

- Second Scenario (Figure 1.10)***

- Principle of Protocol Layering***

- Logical Connections***

Figure 1.10: A three-layer protocol

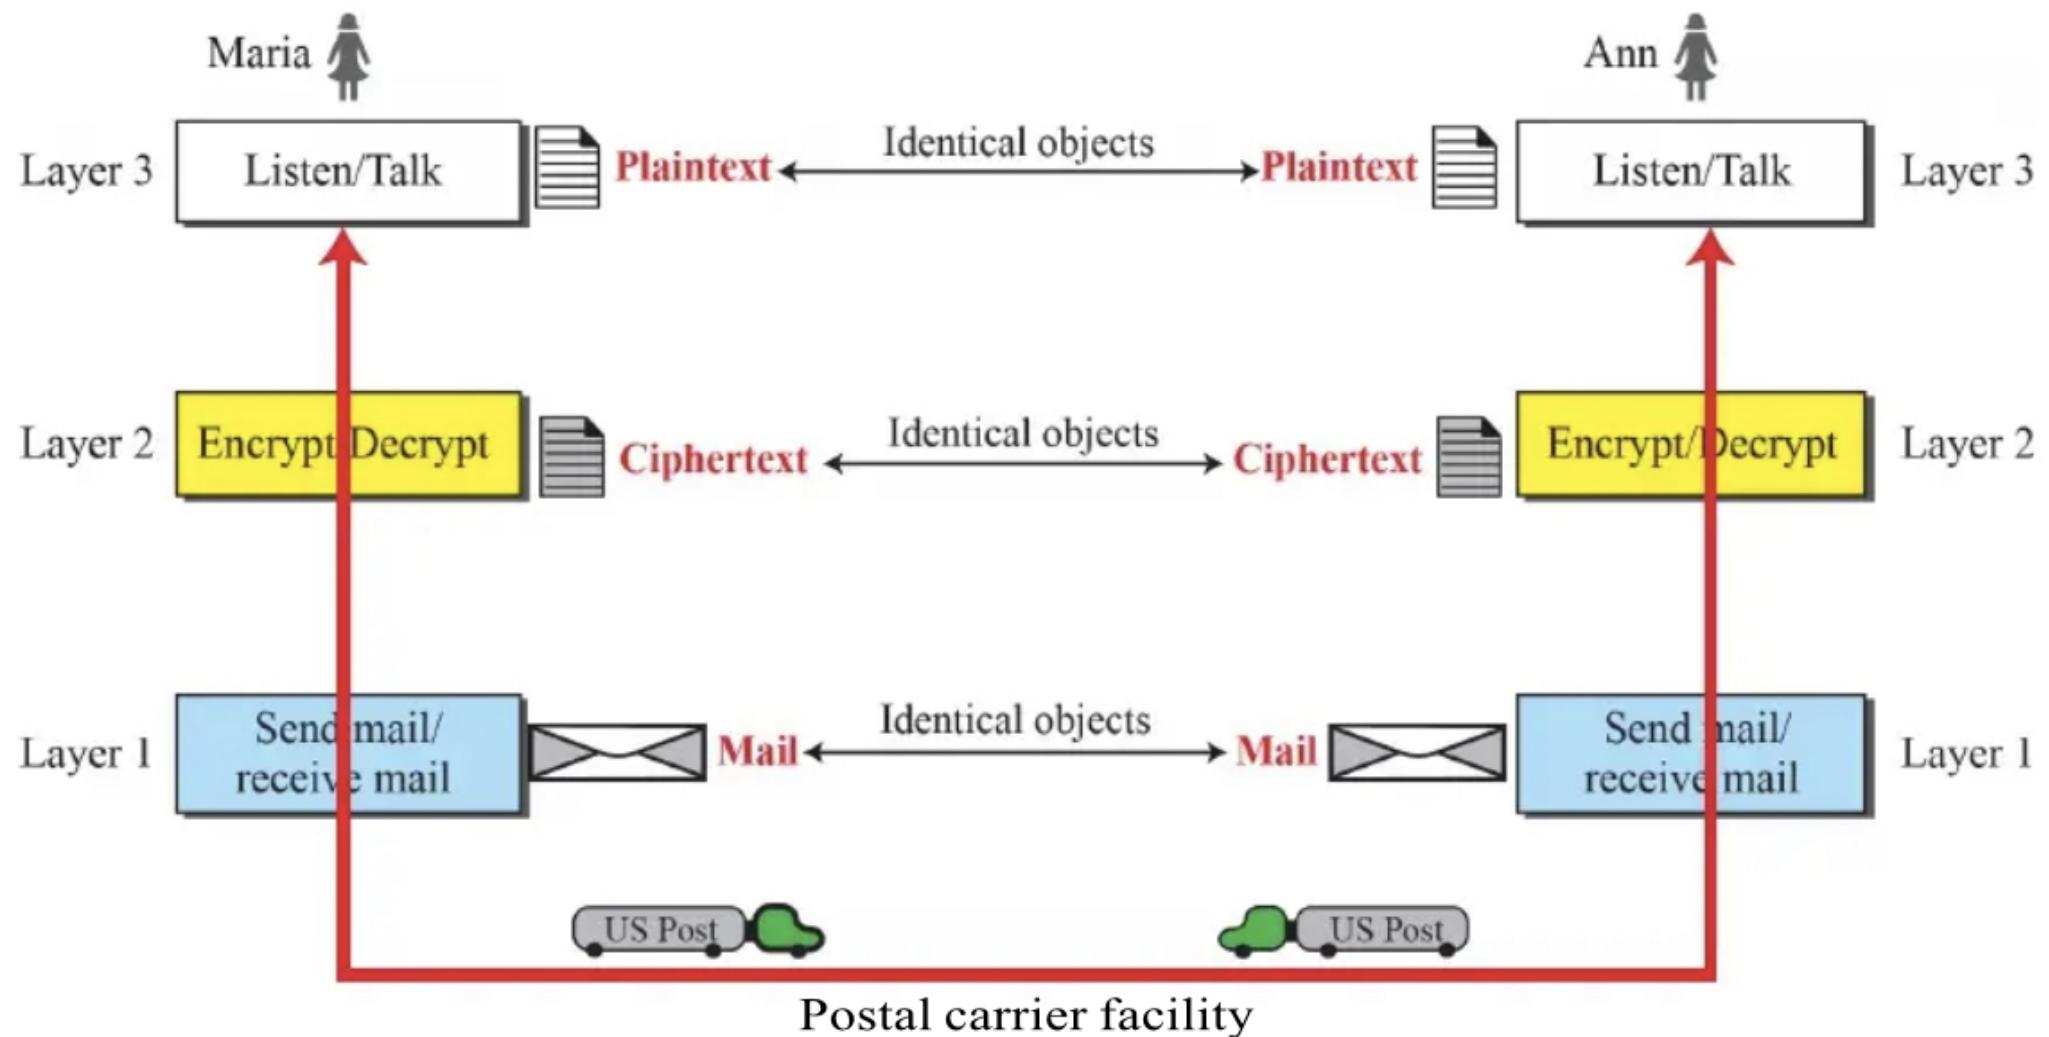

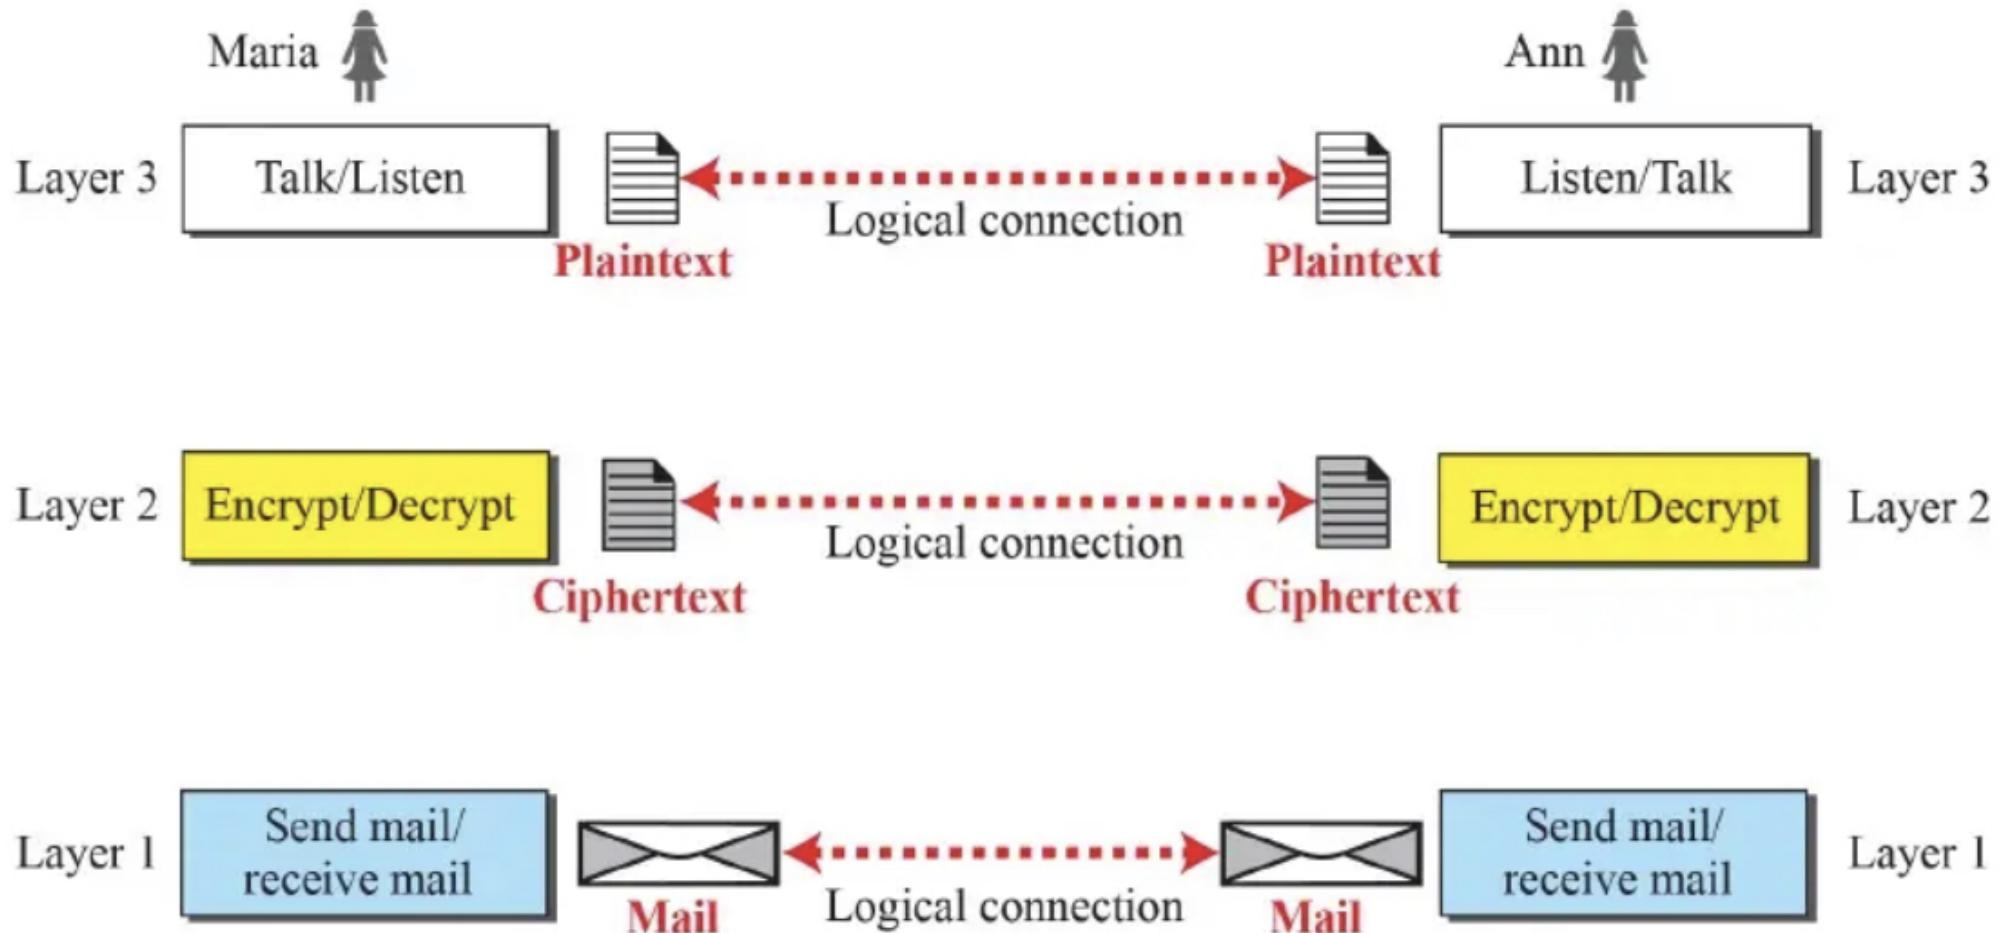

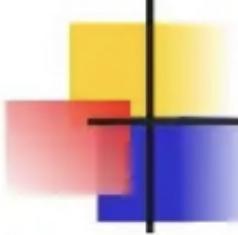

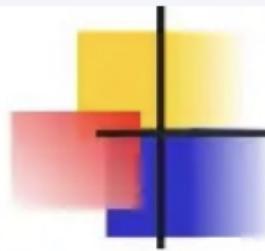

Figure 1.11: Logical connection between peer layers

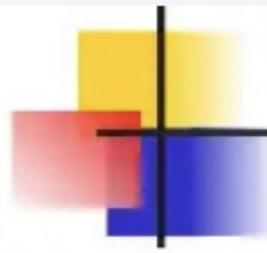

1.2.2 TCP/IP Protocol Suite (continued)

- Layered Architecture***
- Layered in the Suite***
- Description of Each Layer***
 - ❖ *Application Layer*
 - ❖ *Transport Layer*
 - ❖ *Network Layer*
 - ❖ *Data-link Layer*
 - ❖ *Physical Layer*

1.2.2 TCP/IP Protocol Suite

TCP/IP is a protocol suite used in the Internet today. It is a hierarchical protocol made up of interactive modules, each of which provides a specific functionality. The term hierarchical means that each upper level protocol is supported by the services provided by one or more lower level protocols. The original TCP/IP protocol suite was defined as four software layers built upon the hardware. Today, however, TCP/IP is thought of as a five-layer model.

1.2.2 TCP/IP Protocol Suite (continued)

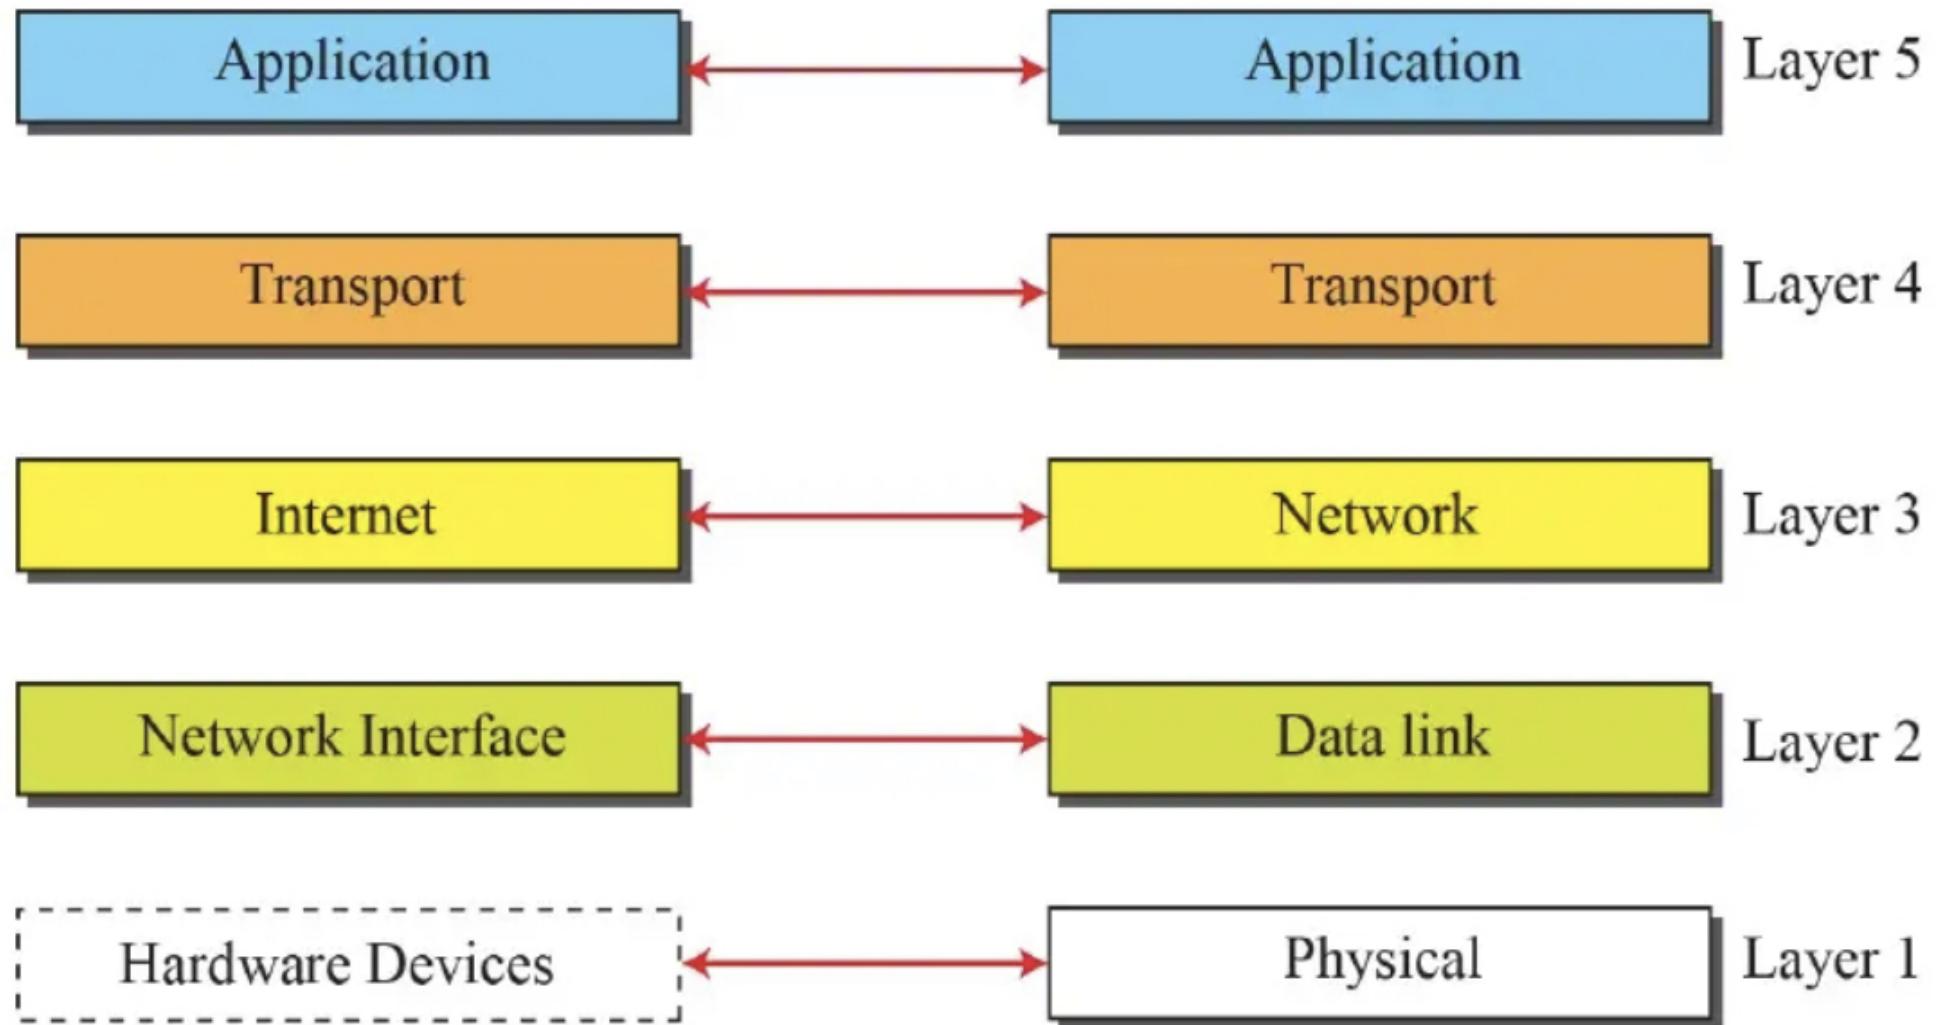

Encapsulation and Decapsulation

- ❖ *Encapsulation at the Source Host*
- ❖ *Decapsulation and Encapsulation at Router*
- ❖ *Decapsulation at the Destination Host*

Addressing

Multiplexing and Demultiplexing

1-3 INTERNET HISTORY

Now that we have given an overview of the Internet and its protocol, let us give a brief history of the Internet. This brief history makes it clear how the Internet has evolved from a private network to a global one in less than forty years.

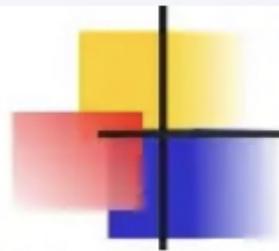

1.3.2 Early History

There were some communication networks, such as telegraph and telephone networks, before 1960. These networks were suitable for constant-rate communication at that time, which means that after a connection was made between two users, the encoded message (telegraphy) or voice (telephony) could be exchanged.

- Birth of Packet-Switched Networks***

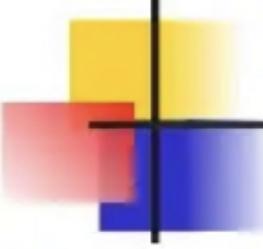

- ARPANET***

1.2.2 The OSI Model

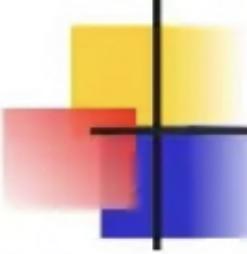

Established in 1947, ISO is a multinational body dedicated to worldwide agreement on international standards. An ISO standard that covers all aspects of network communications is the Open Systems Interconnection (OSI) model. It was first introduced in the late 1970s.

- ***OSI versus TCP/IP***
- ***Lack of OSI Model's Success***

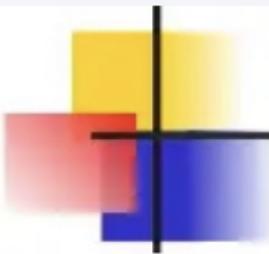

1.3.3 Birth of the Internet (continued)

- TCP/IP***
- MILNET***
- CSNET***
- NSFNET***
- ANSNET***

1.3.3 Birth of the Internet

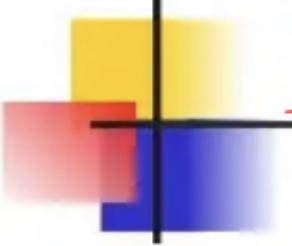

In 1972, Vint Cerf and Bob Kahn, both of whom were part of the core ARPANET group, collaborated on what they called the Internetting Project. They wanted to link dissimilar networks so that a host on one network could communicate with a host on another. There were many problems to overcome: diverse packet sizes, diverse interfaces, and diverse transmission rates, as well as differing reliability requirements.

1.3.3 Internet Today

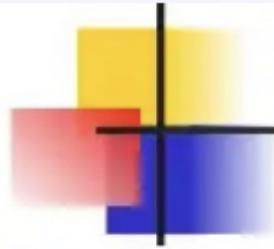

Today, we witness a rapid growth both in the infrastructure and new applications. The Internet today is a set of peer networks that provide services to the whole world. What has made the Internet so popular is the invention of new applications.

- World Wide Web***
- Multimedia***
- Peer-to-Peer Applications***

1.4.1 Internet Standards

An Internet standard is a thoroughly tested specification that is useful to and adhered to by those who work with the Internet. It is a formalized regulation that must be followed. There is a strict procedure by which a specification attains Internet standard status. A specification begins as an Internet draft.

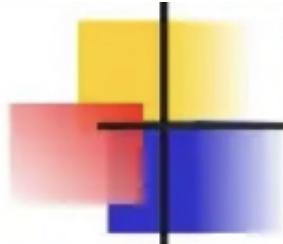

1.4.1 *Internet Standards (Continued)*

Maturity Levels

- ❖ *Proposed Standard*
- ❖ *Draft Standard*
- ❖ *Internet Standard*
- ❖ *Historic*
- ❖ *Experimental*
- ❖ *Informational*

1-4 STANDARDS AND ADMINISTRATION

In the discussion of the Internet and its protocol, we often see a reference to a standard or an administration entity. In this section, we introduce these standards and administration entities for those readers that are not familiar with them; the section can be skipped if the reader is familiar with them.

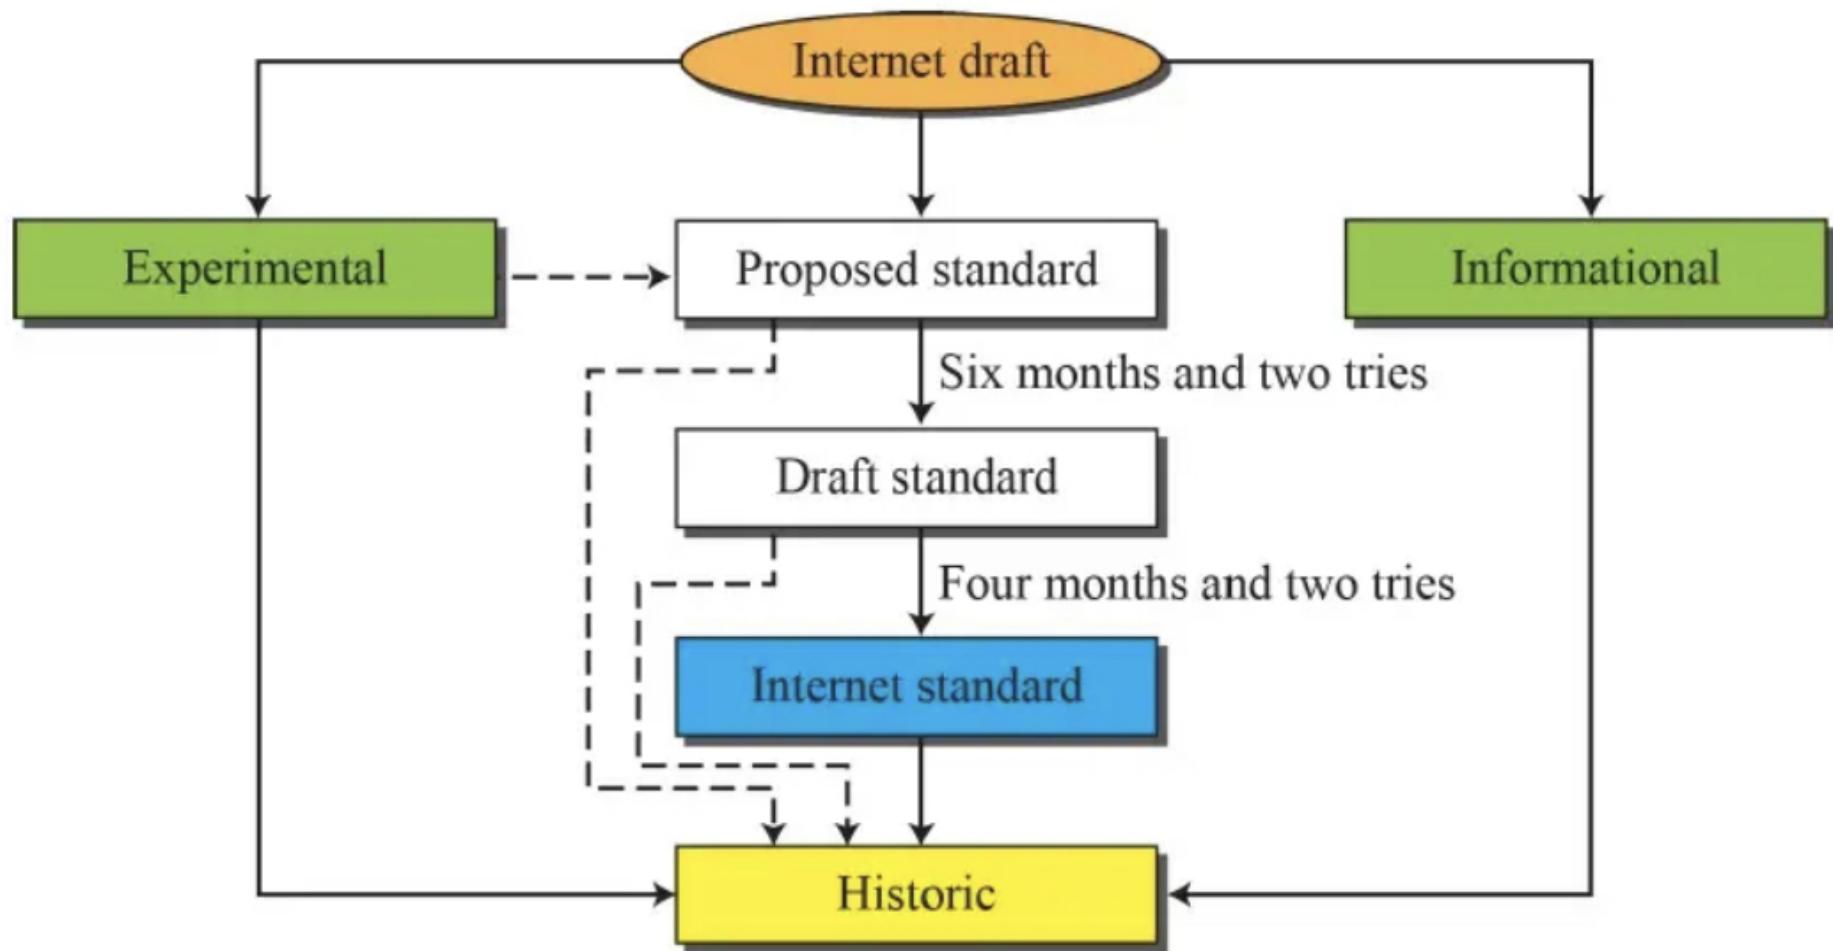

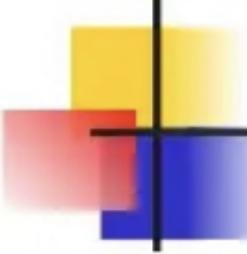

1.4.1 Internet Standards (Continued)

□ Requirement Levels

- ❖ *Required*
- ❖ *Recommended*
- ❖ *Elective*
- ❖ *Limited Use*
- ❖ *Not Recommended*

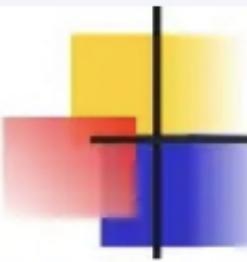

Figure 1.21: Maturity levels of an RFC

1.4.2 Internet Administration

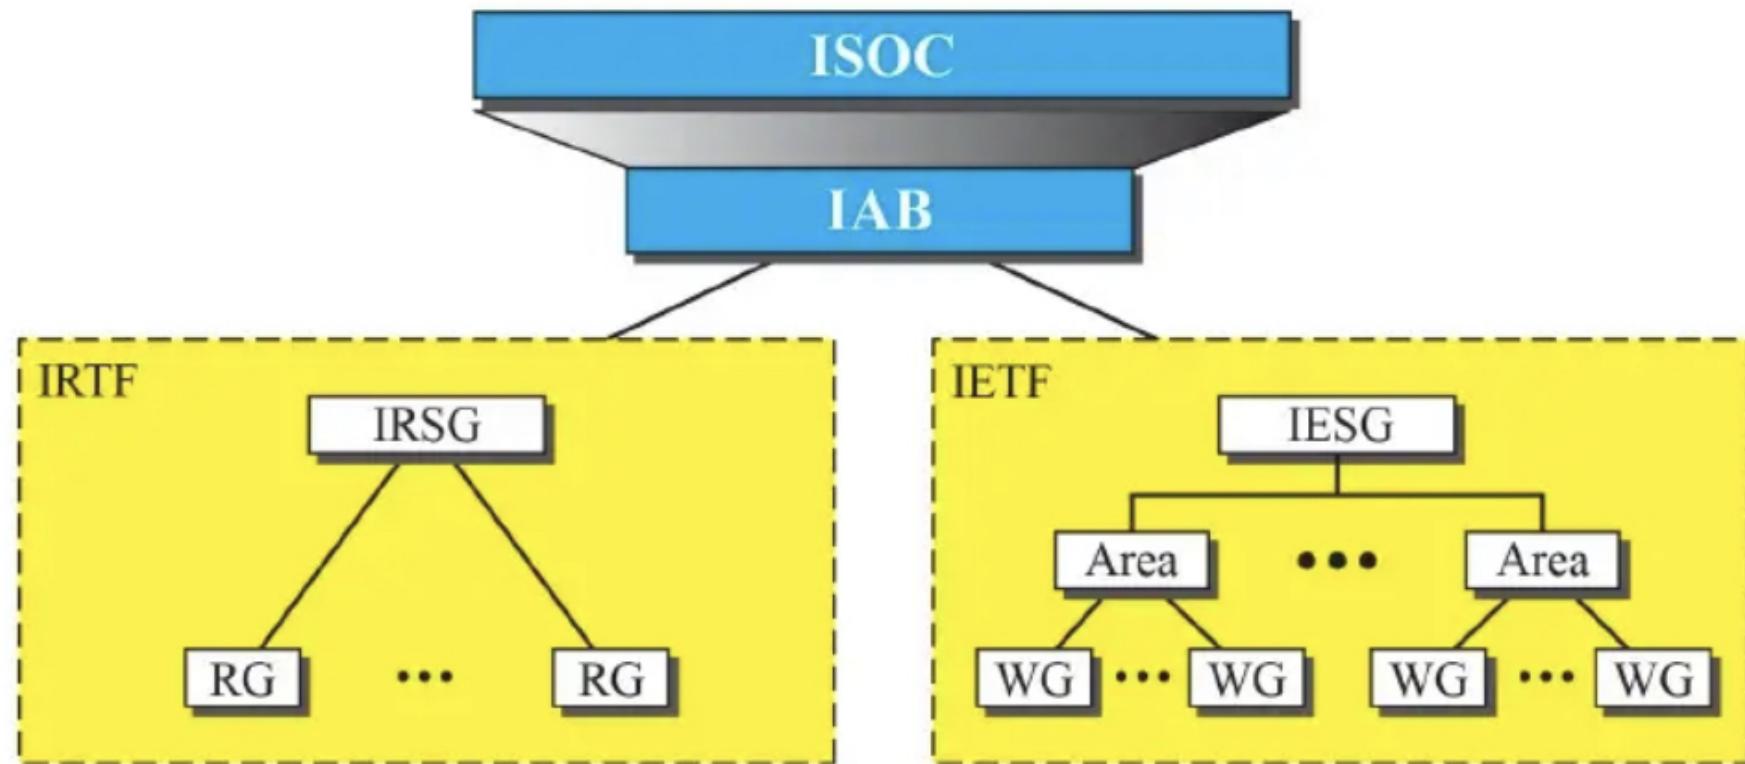

The Internet, with its roots primarily in the research domain, has evolved and gained a broader user base with significant commercial activity. Various groups that coordinate Internet issues have guided this growth and development. Appendix D gives the addresses, e-mail addresses, and telephone numbers for some of these groups.

1.4.2 Internet Administration (continued)

- ISOC***
- IAB***
- IETF***
- IANA and ICANN***
- Network Information Center (NIC)***

Figure 1.22: Internet administration

- *A network is a set of devices connected by communication links. The Internet today is made up of many wide and local area networks joined by connecting devices and switching stations. Most end users who want Internet connection use the services of Internet service providers (ISPs). There are backbone ISPs, regional ISPs, and local ISPs.*
- *A protocol is a set of rules that governs communication. In protocol layering, we need to follow two principles to provide bidirectional communication. First, each layer needs to perform two opposite tasks. Second, two objects under each layer at both sides should be identical. TCP/IP is a hierarchical protocol suite made of five layers: application, transport, network, data-link, and physical.*

- *The history of internetworking started with ARPA in the mid-1960s. The birth of the Internet can be associated with the work of Cerf and Kahn and the invention of a gateway to connect networks. The Internet administration has evolved with the Internet. We discussed ISOC, IAB, IETF, IRTF, ICANN, and NIC.*
- *An Internet standard is a thoroughly tested specification. An Internet draft is a working document with no official status and a six-month lifetime. A draft may be published as a Request for Comment (RFC). RFCs go through maturity levels and are categorized according to their requirement level.*
